Project Name	Voice-Based Concept Understanding Analyser (VBCUA)
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	The user logs into the system dashboard, reviews the prompt/concept requirement, records or uploads their spoken explanation, and clicks submit.	Waits briefly while the background processing executes text transcription, text analysis, and speech metric evaluations.	Views the structured score dashboard, interacts with the waveform visualization graphic, checks specific delivery flaw highlights, and downloads the generated PDF report.

Customer Thought <i>What is the customer thinking?</i>	• "Is my microphone quality clear enough? I hope it accurately records my pauses and pronunciation without dropping off."	• "How long will this processing take? Is the engine calculating semantic match accurately against the reference criteria?"	• "These metrics make complete sense. The highlights show exactly where my filler word counts peaked and why the semantic similarity dropped."
Customer Feeling <i>What is the customer feeling?</i>	Slightly anxious about performance and voice clarity; hopeful that the interface logs the voice data smoothly.	Anticipation mixed with curiosity about the technical assessment details.	Relieved to receive objective, highly actionable, and deterministic scoring data.
Touchpoint <i>What part of the service do they interact with?</i>	• Streamlit Web Front-end interface, interactive audio recorder widget, and file upload element	• Streamlit application loading indicators/spinners running the OpenAI Whisper and Sentence-BERT backend models.	• UI Evaluation Dashboard, Waveform plots, and the ReportLab PDF export download button.

Process Ownership <i>Who is in the lead on this?</i>	Frontend Developer & Audio Interface Lead.	Backend Developer & AI/NLP Model Engineer.	Data Visualization Designer & Report Automation Engineer.
Opportunities <i>How can we improve this stage?</i>	• Implement an inline real-time microphone test utility and volume meter before the recording starts to give users immediate quality assurance.	• Provide a granular processing stage tracker showing discrete statuses (e.g., "Transcribing Speech..." → "Calculating Semantic Alignment...").	• Add an interactive historical chart to the dashboard so that users can view performance improvements across multiple concept trials over time.
